

Thermal Camera Protocol

Updated 10/19/2020

AGHOST Features 3 different FLIR thermal cameras:

FLIR i3 – Point and shoot model

- Ready to use for all investigators
- No major training needed

FLIR E30 – High-end Point and Shoot model

- Tech and team leads ONLY
- Basic Training needed

FLIR B20 – High-end Camera with video option and Wi-Fi

- Tech Leads and Team Leads ONLY
- Basic Training needed

1. Make sure Batteries are charged before use
2. Always keep your hand in the harness or strap at ALL times
3. Thoroughly familiarize yourself with the thermal camera you are using.
4. It is very important that you familiarize yourself with how body heat works, how it reflects in a room, what surfaces reflect your heat, and how long your heat signature stays visible. It's very easy to mistake your own heat reflection for a paranormal presence, as your body heat will reflect off of just about any shiny surface, and even some that you don't expect.

5. A standard camera or video should be used for control shots
6. Make sure your thermal imaging camera is in focus at all times.
7. We've learned over several investigations that balls of cold temperature detected by the thermal imaging camera may indicate a sudden energy void caused by paranormal activity.
8. You may also be able to see the heat exchange of spiritual energy moving past energy. If energy is being removed from an area for a spirit to manifest or move an object there is a chance that the thermal imaging camera will capture the cold spot left by the void or energy.
